

Product Name : Mesdopetam hemitartrate
Cat. No. : PC-47115
CAS No. : 2562346-14-7
Molecular Formula : C₁₂H₁₈FNO₃S·1/2C₄H₆O₆
Molecular Weight : 700.77
Target : Dopamine Receptor
Solubility : 10 mM in DMSO

Biological Activity

Mesdopetam (IRL790) is a novel dopamine transmission modulator and dopamine D3 receptor antagonist with Ki/IC50 of 0.09/0.41 μ M.

IRL790 also shows sub-micromolar affinities at DA D2 and σ 1 receptors, and micromolar affinities at 5-HT1a, 5-HT2a, and 5-HT7 receptors, does not show any agonist-like properties at D2, D3, 5-HT2, or 5-HT7 receptors.

IRL790 displays balancing effects on aberrant motor phenotypes, reducing L-DOPA-induced dyskinesias in the rodent 6-hydroxydopamine lesion model and reducing psychostimulant-induced locomotor hyperactivity elicited by pretreatment with either d-amphetamine or dizocilpine, without negatively impacting normal motor performance.

IRL790 is active in models of perturbed dopaminergic and glutamatergic signaling, including rodent 6-hydroxydopamine L-DOPA-induced dyskinesias and psychostimulant-induced hyperactivity, in a dose range that does not impair normal behavior.
